Behavior Aisle

X profile import: demo

visionOS · org.dicyaninlabs.behavioraisle · 2026-11-08

Flow: handle -> profile fetch -> post read -> LLM trait classify -> HumanHD shopper + thought cloud

Captured from the app via DicyaninStageDirector routes, Apple Vision Pro simulator, 3840x2160

Unit test PredictorTests.testProfileHeuristicBuildsPersona: passed

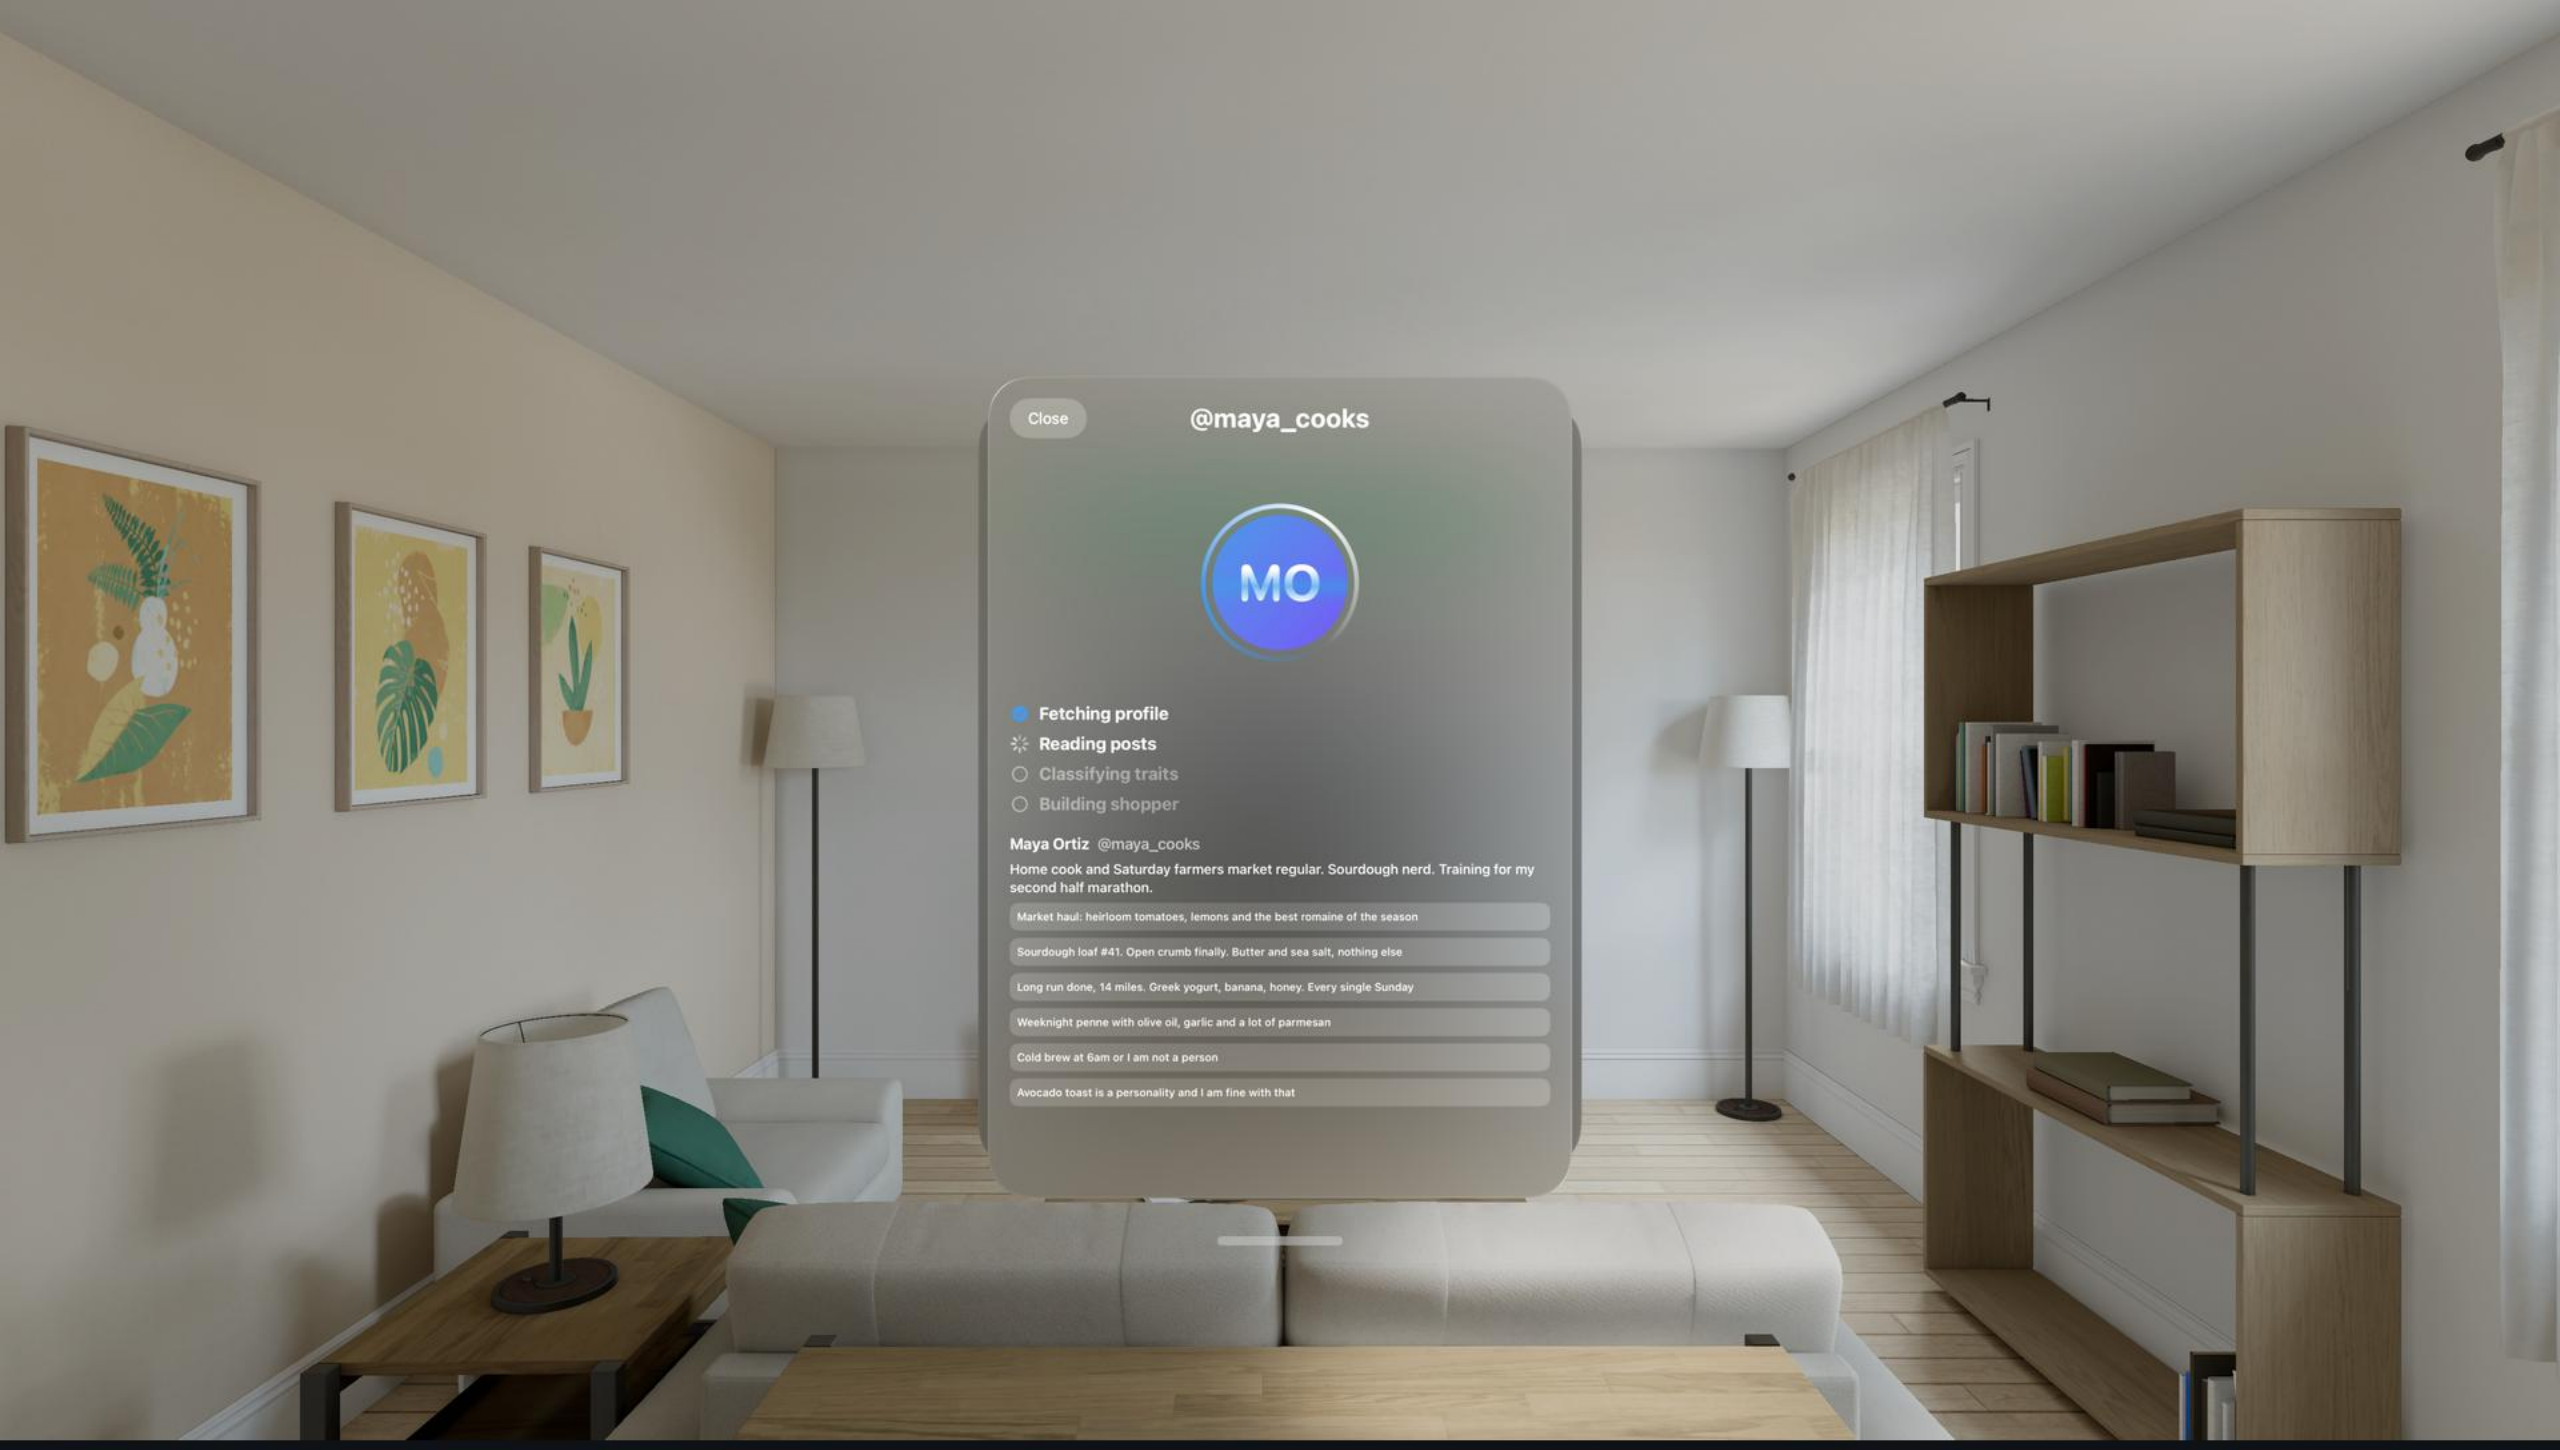

Shots use a fixture profile (@maya_cooks); live X/OpenRouter keys not yet configured in the proxy env

1. Import an X profile

Shop as them opens the analysis sheet. Scanner ring spins while the proxy fetches the X profile (GET /twitter).

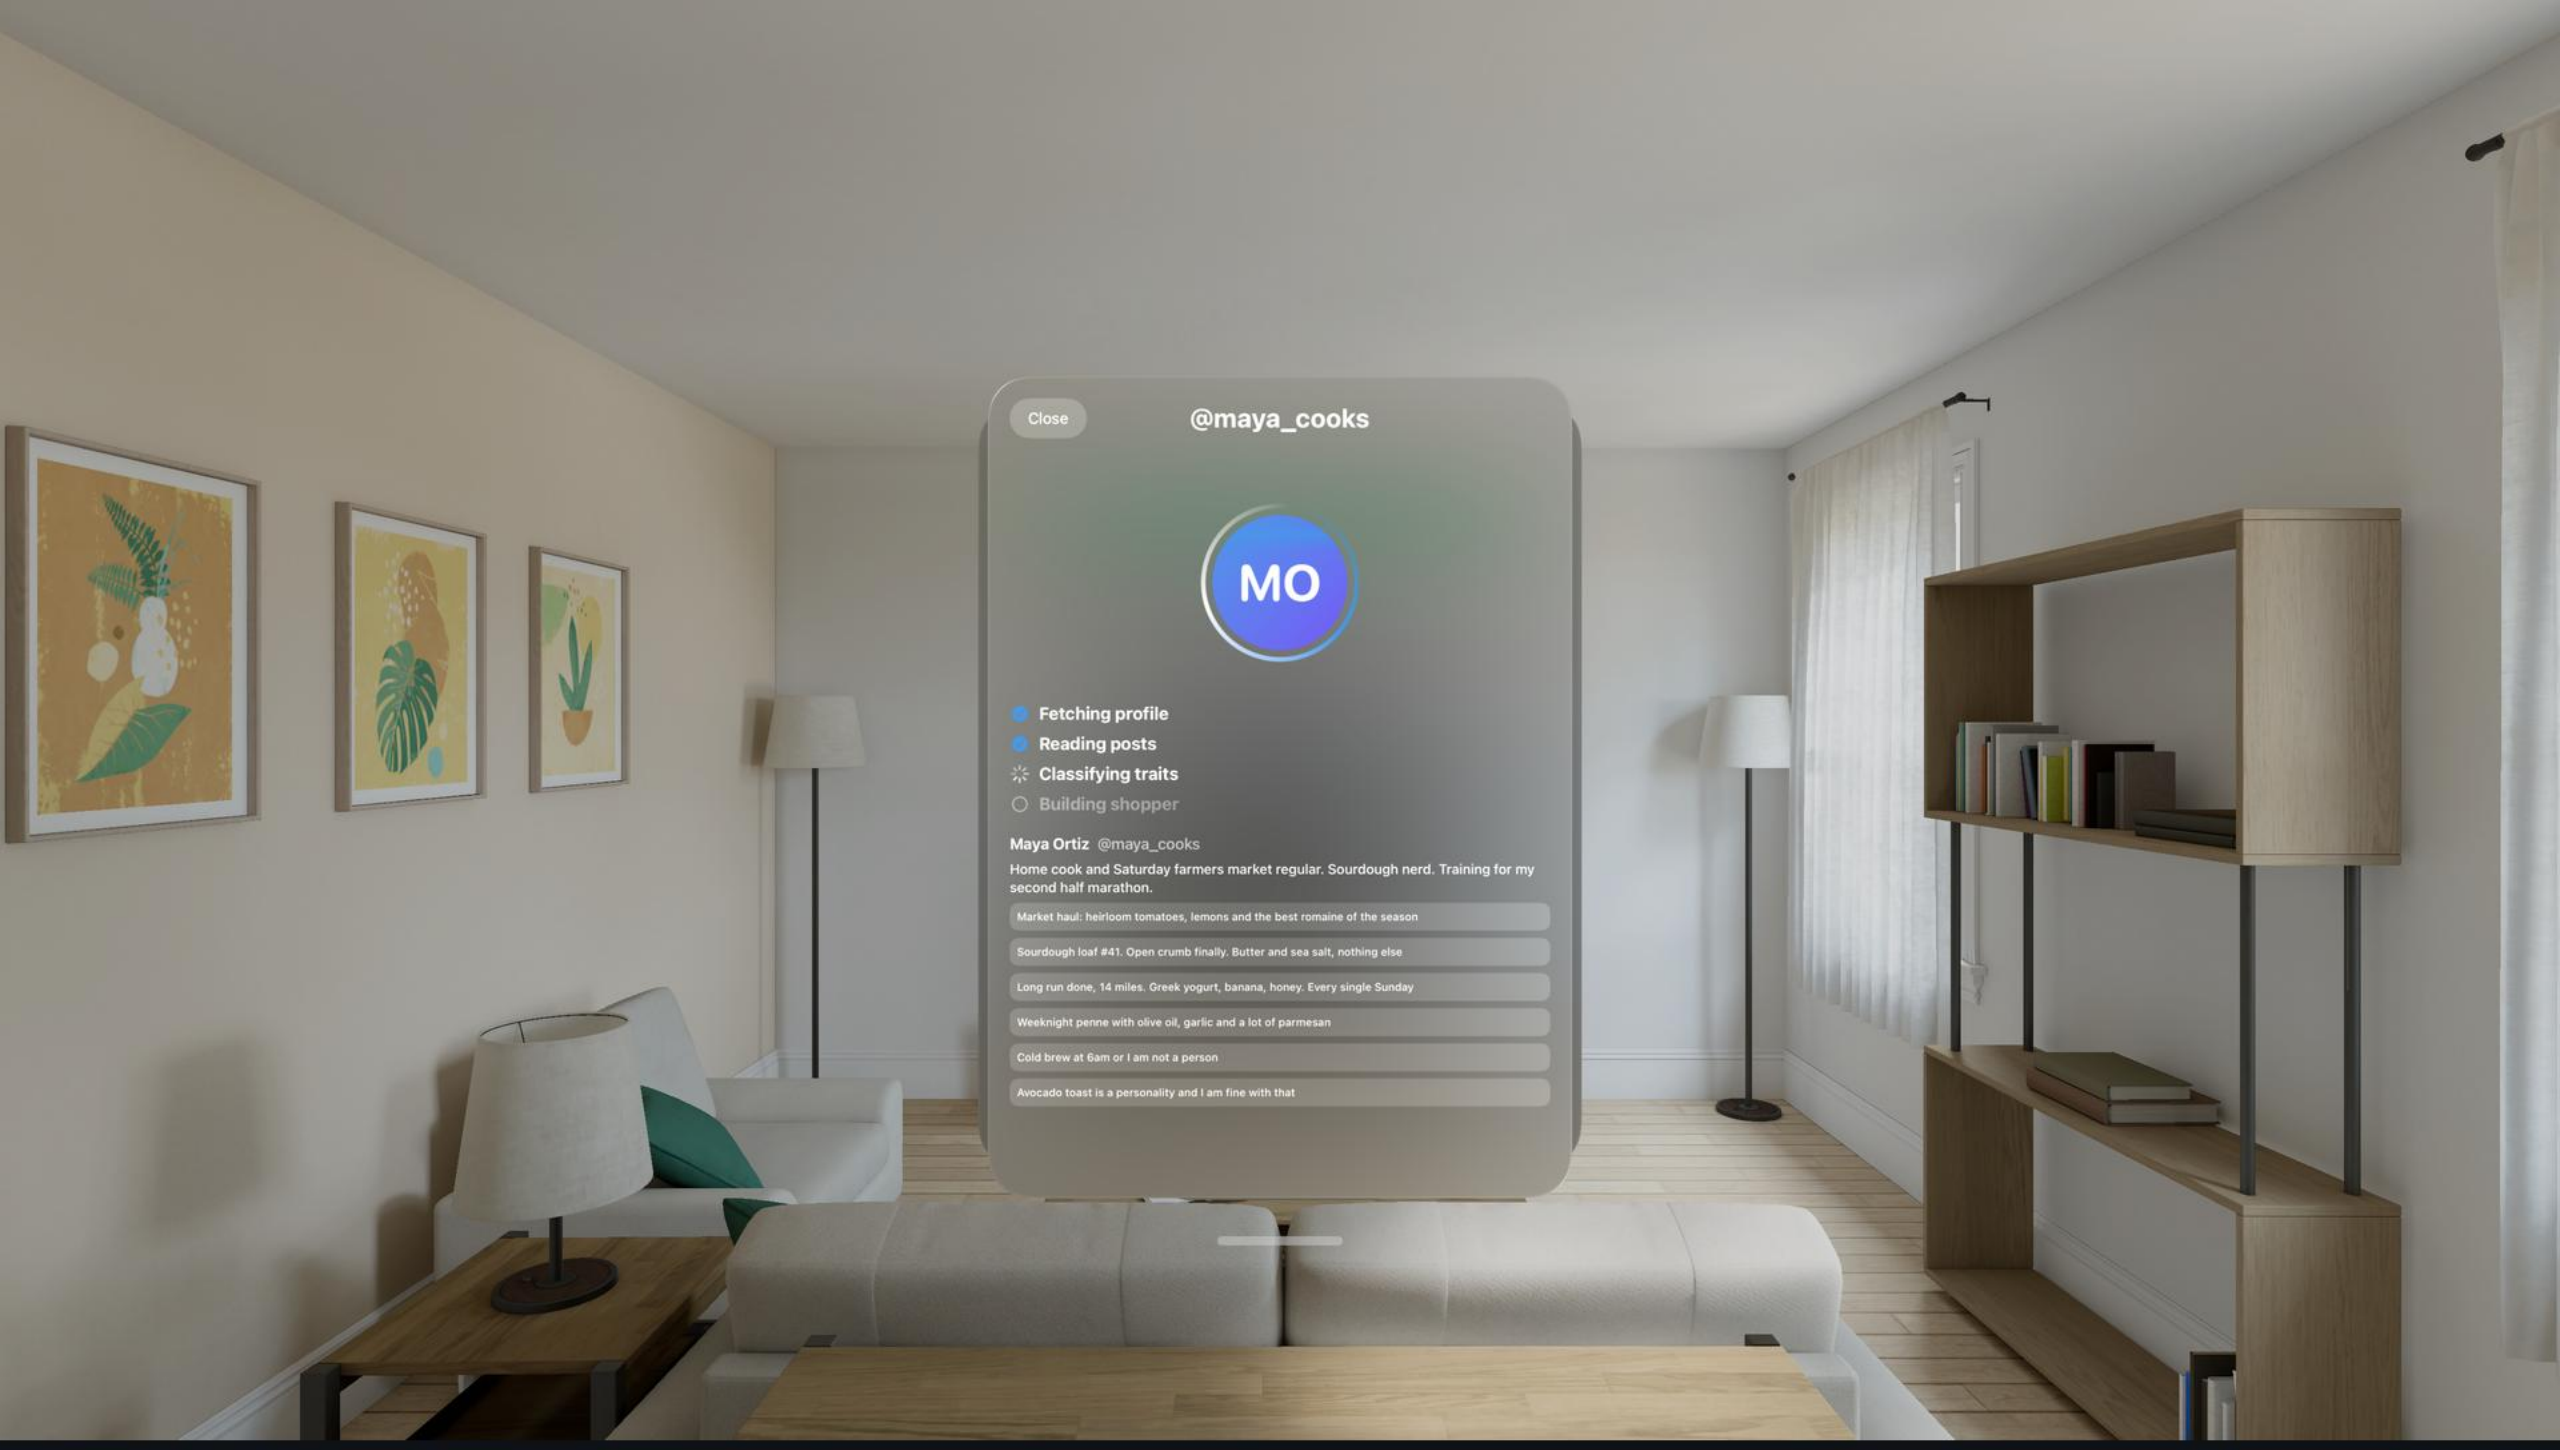

route profile/fetching

2. Reading posts

Profile, bio and recent posts stream in one by one. Stage list tracks the four steps.

route profile/reading

3. Classifying traits

Posts and avatar go to OpenRouter (POST /classify, JSON schema): body traits from the photo, shopping traits from posts.

route profile/result {'stop': 'classifying'}

4. Predicted shopping profile

Interest tags, a one-line summary, category affinity bars and the likely-to-buy list from the store catalog.

route profile/result

5. Shopper with thought cloud

HumanHD shopper built from the classified traits (curly hair, skin tone, build, outfit). Thought cloud shows wishlist items.

route store/shopper {'dist': '2.6'}

6. Predictions in the aisle

The shopper joins the live simulation; prediction cards over every shopper show next-action probabilities.

route store/shopper {'dist': '3.4', 'cards': '1', 'x': '0', 'yaw': '0'}
