Behavior Aisle: predicted intent

X profile -> interests -> predicted groceries -> the shelf they walk to.

New since the X profile demo: intent panel, shelf beacon, floor path, reason per item.

1. Profile read

Interests and category affinity from @maya_cooks bio and posts.

2. Interest to item

Panel ties each predicted item to the interest that explains it (farmers market -> Roma Tomatoes).
Probability, aisle and rank per item. Rank 1 highlighted in the shopper color.

2b. Panel close-up

Roma Tomatoes, Red Apples, Navel Oranges, each traced to 'farmers market', Aisle 1 Produce.

3. Where they go next

Marching dotted path on the floor from the shopper toward the aisle spot.

Light beam and pulsing ring on the rank-1 product, quieter rings on ranks 2-3.

Blindspots left

- Packed density hangs store generation in the simulator at 2%; captures use stocked.
- Probabilities are flat (7-8%) over 32 SKUs; show share vs. uniform 3% or top-3 mass.
- Panel and beacon too small at 3 m; needs a viewer-facing HUD or closer camera route.
- Rank-1 shelf (Aisle 1) sits off-frame from the center aisle; camera should pan to it.
- Viewer has no store-level answer: which shelves this profile will hit (aisle heat for one person).
